New claims marked-up

1. A computer-implemented method, comprising:
- 5 while an electronic device is in a first user-interface state, detecting progress towards satisfaction of a user input condition needed to transition to a second user-interface state;
- characterized in that**
- the method further comprises:**
- 10 while the device is in the first user-interface state, indicating progress towards satisfaction of the condition by transitioning an optical intensity of one or more user interface objects associated with the second user-interface state without being associated with the first user interface state, wherein at least one of the one
- 15 or more user interface objects associated with the second user interface state is not displayed prior to detecting progress toward satisfaction of the user input condition and, wherein transitioning the optical intensity includes the one or more user interface objects associated with the second user-interface state
- 20 appearing and increasing in optical intensity; and transitioning the device to the second user-interface state if the condition is satisfied.
2. The method of claim 1, wherein the device comprises a touch-
- 25 sensitive display, and wherein satisfying the condition comprises detecting contact with the touch-sensitive display that corresponds to a predefined gesture.
3. The method of claim 1, wherein the device comprises a touch-
- 30 sensitive display, and wherein satisfying the condition comprises: displaying an image on the touch-sensitive display; and detecting contact with the Touch-sensitive display that corresponds to a predefined gesture with respect to the image.

2

4. The method of claim 1, wherein the device comprises a touch-sensitive display, and wherein satisfying the condition comprises: displaying an image on the touch-sensitive display; and detecting contact with the touch-sensitive display that corresponds to moving the image to a predefined location on the touch-sensitive display.
5. The method of claim 1, wherein the device comprises a touch-sensitive display, and wherein satisfying the condition comprises: displaying an image on the touch-sensitive display; and detecting contact with the touch-sensitive display that corresponds to moving the image along a predefined path on the touch-sensitive display.
6. A portable electronic device, comprising:
a touch-sensitive display;
memory;
one or more processors; and
one or more modules stored in memory and configured for execution by the one or more processors, the one or more modules including instructions for:
while the device is in a first user-interface state, detecting progress towards satisfaction of a user input condition needed to transition to a second user-interface state;
characterized in that
the one or more modules further include instructions for:
while the device is in the first user-interface state, indicating progress towards satisfaction of the condition by transitioning an optical intensity of one or more user interface objects associated with the second user-interface state without being associated with the first user interface state, wherein at least one of the one or more user interface objects associated with the second user interface state is not displayed prior to detecting progress toward satisfaction of the user input condition and, wherein

3

transitioning of the optical intensity includes the one or more user interface objects associated with the second user-interface state appearing and increasing in optical intensity; and.

transitioning the device to the second user-interface state if the condition is satisfied.

7. The device of claim 6, wherein satisfying the condition comprises detecting contact with the touch-sensitive display that corresponds to a predefined gesture.

8. The device of claim 6, wherein satisfying the condition comprises:

displaying an image on the touch-sensitive display; and

detecting contact with the touch-sensitive display that corresponds to a predefined gesture with respect to the image.

9. The device of claim 6, wherein satisfying the condition comprises:

displaying an image on the touch-sensitive display; and

detecting contact with the Touch-sensitive display that corresponds to moving the image to a predefined location on the touch-sensitive display.

10. The device of claim 6, wherein satisfying the condition comprises:

displaying an image on the touch-sensitive display; and

detecting contact with the touch-sensitive display that corresponds to moving the image along a predefined path on the touch-sensitive display.

11. A computer readable storage medium having stored therein executable instructions, which when executed by an electronic device, cause the device to:

while the device is in a first user-interface state, detect progress towards satisfaction of a user input condition needed to transition to a second user-interface state;

characterized in that

said executable instructions, when executed by the electronic device, further cause the device to:

while the device is in the first user-interface state, indicate progress towards satisfaction of the condition by transitioning an optical intensity of one or more user interface objects associated with the second user-interface state without being associated with the first user interface state, wherein at least one of the one or more user interface objects associated with the second user interface state is not displayed prior to detecting progress toward satisfaction of the user input condition and, wherein transitioning the optical intensity includes the one or more user interface objects associated with the second user-interface state appearing and increasing in optical intensity; and transition the device to the second user-interface state if the condition is satisfied.

12. The computer readable storage medium of claim 11, wherein the device comprises a touch-sensitive display, and wherein detecting progress towards satisfaction of the condition includes detecting contact with the Touch-sensitive display corresponding to a predefined gesture.

13. The computer readable storage medium of claim 11, wherein the device comprises a touch-sensitive display, and wherein detecting progress towards satisfaction of the condition includes: displaying an image on the touch-sensitive display; and detecting contact with the touch-sensitive display corresponding to a predefined gesture with respect to the image.

5

14. The computer readable storage medium of claim 11, wherein the device comprises a touch-sensitive display, and wherein detecting progress towards satisfaction of the condition includes:
displaying an image on the Touch-sensitive display; and
5 detecting contact with the Touch-sensitive display corresponding to moving the image to a predefined location on the touch-sensitive display.
15. The computer readable storage medium of claim 11, wherein the device comprises a touch-sensitive display, and wherein detecting
10 progress towards satisfaction of the condition includes:
displaying an image on the Touch-sensitive display; and
detecting contact with the touch-sensitive display corresponding to moving the image along a predefined path on the touch-
15 sensitive display.
